

WHAT IS CLAIMED IS:

1 1. A locking device for a ceiling mounted movie player, the locking device
2 comprising:

3 a mounting plate for pivotally receiving therein a movie player, the mounting
4 plate having multiple pairs of L-shaped legs oppositely formed on opposite sides of a
5 face of the mounting plate and first ears each formed on a peripheral side face of the
6 mounting plate and having a first hole defined through the first ear;

7 a base adapted to be securely engaged with a vehicle ceiling, the base having
8 multiple pairs of holes defined to correspond to the L-shaped legs so that the L-shaped
9 legs are able to be inserted into the holes to secure engagement between the mounting
10 plate and the base, the base further having second ears each formed on a peripheral side
11 face of the base and having a second hole defined through the second ear to correspond
12 to and mate with the first hole of the first ear such that after the L-shaped legs are
13 inserted into the holes of the base, relative movement of the mounting plate to the base
14 allows the mounting plate to securely engage with the base and thus screws are able to
15 be extended through the mated first and second holes of the mounting plate and the base
16 to fix relative position between the mounting plate and the base.
